

WATER YEAR 2008 Comments

January 5, 2009

Brad Tom, Kate Le, Chris Enright (DWR)

The DAYFLOW database has been extended to include water year 2008. Below are a few highlights of this year's effort:

- The 2008 Dayflow data set now available at the [Dayflow website](#).
- This year QXGEO flows are a mix of measured and estimated flows because some of the measured flow data for Delta Cross Channel and Georgiana contain missing records. As a result, the old method to compute QXGEO flows is used to handle missing flow records only.
- Some of the input data sets used for water year 2008 outflow estimates are labeled “provisional” by the responsible agency. These include discharge from flow and stage ratings at Sacramento, Yolo Bypass, Delta Cross Channel, and Georgiana Slough. These provisional data sets will be updated summer 2009 with the hope that official sets will be available then.
- Dayflow data users can usually answer most questions by referencing the extensive [documentation](#) on the Dayflow web site.
